

## Real Time Network Director

---

*The Director provides the framework within which all other modules can perform their specialized roles in contribution to the larger application*

### **EXECUTIVE SUMMARY:**

Just like in any corporate structure there are many managers with specific roles and responsibilities within the organization. But the activities and communication channels for these valuable personnel must still be organized and coordinated by someone further up in the hierarchy. REWSS has adopted a similar model in deploying its suite of solutions to its customers. As such, the Real Time Network Director is the glue that binds together and coordinates the basic package of REWSStools® modules in conjunction with any other optional modules installed.

**VALUE FOR THE OPERATOR:**

The Real Time Network Director is included by default in the basic package of REWSStools® since it is mandatory for any installation where all other modules are dependent upon it to fulfill their specific functions. As such, the Director provides the framework within which all other modules can perform their specialized roles in contribution to the larger application. All modules are integrated seamlessly into the intuitive framework so that users always have simple access to each feature. Whenever appropriate, the data owned by one module has the additional functionality of lateral interlinking to the data owned by another module. This can be a very powerful feature in troubleshooting issues on the network.

**BASIC MODULES (INCLUDED BY DEFAULT):**

- Real Time Network Director
- Performance Manager
- Fault Manager
- Exception Manager

**OPTIONAL MODULES:**

- Benchmark/KPI Manager
- Compliance Manager
- Call Trace Manager
- Roaming Manager
- Forecast Manager
- Port Manager
- Outage Manager
